Hiring Team
BillionToOne
Menlo Park, California

Dear Hiring Team,

I am applying for the Software Engineering Internship. BillionToOne is doing something I care about deeply: making life-changing diagnostics accessible and taking the fear of the unknown out of some of the hardest moments in medicine. I spent two years building production clinical software before grad school, and my recent work is squarely in AI-backed services and full-stack products, so this role sits right at the intersection of what I have done and what I want to do next.

The healthcare side is familiar ground for me. At Wysa I engineered a multi-tenant NHS clinical eTriage backend serving 8+ UK clinical clients over sensitive patient data, and I built a full-stack React and Node.js platform used daily by our team to structure and label clinical data. I took the handling of PII seriously, implementing AWS KMS encryption, hardening authentication, and remediating 20+ security findings. My first publication was in this space too, a deep transfer-learning approach to Alzheimer's classification, so working close to patient care is genuinely motivating for me.

Your example projects map almost directly onto what I have built. I created AgenticSearch, a Python and FastAPI service that turns messy, open-ended inputs into structured, verifiable data tables with cell-level provenance, hardened with 150+ automated tests. That is essentially the shape of an AI-backed service like insurance card scanning: taking unstructured input and producing reliable, structured, auditable output. I have shipped LLM features in production and iterated on prompts, I work day to day in Python and across the web stack, and I care about writing clean, well-tested code and reviewing it carefully.

I would love to help build portal features and AI-driven services that reach patients directly, and to learn the diagnostics side from the scientists and clinicians on your team. Thank you for your time and consideration.

Sincerely,
Deva Anand
