Siemens EDA — Electronic Board Systems
Infrastructure & Security Team

Dear Hiring Team,

I'm applying for the Software Engineer Intern role on the Infrastructure & Security team. I'm a Computer Science master's student at UMass Amherst, and what drew me in is that the role is about building tooling that makes other engineers' work better, code quality, analytical reporting, and security, which is the kind of behind-the-scenes work I genuinely enjoy.

A lot of my experience maps directly. I use Python and shell scripting to build data and reporting tools: I wrote a Spark pipeline that analyzed a 1.4-billion-row dataset and used stage-level metrics to produce a documented, reproducible report of where time was being spent, and I built AutoEval, a Python tool that evaluates systems and commits auditable "report cards" back to Git. On code quality, I hardened a multi-stage Python service with 150+ automated tests and structured it as modular, testable stages, and at Wysa I took part in a code-quality pilot using GitHub Copilot for tech-debt cleanup and maintained a conventions file so generated code stayed aligned with team standards.

Security is a real interest, not a checkbox. At Wysa I owned reliability and security for a multi-tenant healthcare system, remediating 20+ penetration-testing findings and enforcing secure-by-default patterns across tenant isolation and access paths.

I'll be straight that my C++ and Java are at the coursework level rather than "strong competency" yet, my production work has been Python and JavaScript/TypeScript. But I read and write C++ from my performance-engineering coursework, I pick up languages quickly, and I'm comfortable advocating a technical decision and then revising it when a senior engineer pushes back. Mostly, I'm curious and I like making developer workflows cleaner. I'd welcome the chance to contribute.

Thank you for your time and consideration.

Sincerely,
Deva Anand
