Dear Rippling Hiring Team,

I am applying for the Engineering Internship at Rippling. One system that runs HR, IT, and Finance and automates the entire employee lifecycle is exactly the kind of ambitious full-stack product I want to build, and the role's emphasis on ownership and shipping real features fits how I work. I am an MS Computer Science student at UMass Amherst with two years of production backend experience and a track record of shipping full-stack products end to end.

The clearest example is Underdogs Fitness, a gym-management platform I built and deployed solo for a real client (React + Redux, Node.js, Express, MongoDB). I implemented hybrid Stripe and manual-cash payments backed by a partial-payment ledger, cron-based renewal automation, and a multi-branch architecture from day one, so when the client opened a second location a year later it onboarded as a configuration change with zero schema migration. More than 90% of payments moved through the portal, the client's manual workload dropped about 70%, and the platform is still in production three-plus years later. Owning a product from database to deployment, including the payments flow, is exactly the kind of work this team does.

I have also worked full-stack and cross-functionally in industry. At Wysa I built a full-stack internal product (React, Node.js) used daily by the AI team, owned reliability for a multi-tenant backend serving 8+ clients and 10,000+ monthly submissions, and partnered with clinical and product teams as the eTriage backend's primary point of contact. I work comfortably across Python (FastAPI) and JavaScript/React, and I am always building, most recently a Python service hardened with 150+ automated tests.

I would be excited to bring this full-stack, ownership-first mindset to Rippling, learn the business and your clients' needs, and ship features that matter. Thank you for considering my application; I would welcome the chance to talk.

Sincerely,

Deva Anand
