Hiring Team
ACI Worldwide
Norcross, Georgia

Dear Hiring Team,

I am applying for the Software Engineering Intern position on your real-time payments team. What draws me to ACI is the nature of the software: mission-critical, real-time systems where correctness is not a nice-to-have but the whole point. That is the kind of work I spent two years doing before graduate school, and it is the environment I do my best work in. I am currently a Master of Science student in Computer Science at UMass Amherst, graduating in May 2027, and looking for a summer internship where the stakes are real.

For two years at Wysa I owned a multi-tenant NHS eTriage backend (Node.js, MongoDB) that served 8+ UK clinical clients and processed 10,000+ triage submissions a month through REST and JSON integrations with a third-party platform. That role was almost entirely the work your posting describes. I designed, built, tested, and delivered features on an Agile team; I hardened authentication and rate limiting, added integration tests to protect against regressions, implemented AWS KMS encryption for sensitive data, and remediated 20+ penetration-testing findings. I also spent a good deal of time researching and resolving customer-reported problems, monitoring production logs during releases and client integrations and shipping targeted fixes for tenant-specific incidents to keep the shared service stable. Working on regulated clinical data taught me to treat security, controls, and risk as part of the job rather than overhead.

I am also drawn specifically to the payments domain. As a freelance project I built and shipped Underdogs Fitness, a production platform with Stripe online payments alongside a manual-cash partial-payment ledger that has to reconcile exactly, and it has run in production for 3+ years. It is a small system next to ACI's, but it gave me real appreciation for how much rides on getting money movement right. On the tooling your team values, I work daily in Git, Docker, Linux, and JSON-based services, have used Kubernetes, and build backend and microservice-style APIs; my Java is coursework-level, and I am confident I can get productive quickly in a Java and Vert.x or Spring Boot stack, because picking up a new framework fast is something I have done repeatedly.

I would be glad to talk about how I can contribute to your real-time payment solutions this summer. Thank you for your time and consideration.

Sincerely,
Deva Anand
