Hiring Team
ASM
Phoenix, Arizona

Dear Hiring Team,

I am applying for the Software Engineering Internship. ASM builds the equipment behind the chips that power everything from 5G to autonomous driving, and this role is about the software that keeps that engineering moving: automation and tooling that makes configuration and validation faster, more reliable, and secure for engineering and QA. That is exactly the kind of work I gravitate toward. I like building the internal tools other engineers quietly depend on.

I have done this in practice. At Wysa I architected a full-stack internal tooling platform used daily by our AI team that cut manual work by 100+ hours per month, and I set up automation such as git-webhook build and deploy pipelines on other projects. I also build for validation and visibility: I hardened one of my agentic services with 150+ automated tests and pipeline instrumentation, and at Wysa I added integration tests for regression protection and monitored production logs to get clear visibility into incidents.

Reliability and security are habits for me, not afterthoughts. I implemented AWS KMS encryption for sensitive data, hardened authentication and rate limiting, and remediated 20+ penetration-test findings on a production backend. I am also comfortable close to the systems layer: I optimized C++ matrix multiplication with SIMD and OpenMP and validated its performance with Linux perf. Day to day I work across Python, C++, and JavaScript/TypeScript on Linux.

I would be glad to bring that mix of automation, testing, and reliability to the fast-paced environment at ASM, and to learn the semiconductor side from the engineers building it. Thank you for your time and consideration.

Sincerely,
Deva Anand
