Festo Corporation, AI Engineering Team

Re: AI Engineer Intern, Ad Code 14938

Dear Festo Hiring Team,

I am applying for the AI Engineer Intern role. I am a master's student in Computer Science at UMass Amherst, and most of what I build these days is exactly what this role describes: taking AI capabilities and turning them into real software that people can actually use. The framing of applying AI within real-world business applications, rather than in a demo, is what drew me to Festo.

A lot of my recent work is about keeping AI grounded and dependable. At an early-stage healthtech startup I am building features that integrate a large language model (Gemini) into a real clinical application, with the model constrained to synthesis while the backend deterministically controls the results, so the output stays verifiable rather than a black box. On the project side, I built an agentic web-discovery service in Python and FastAPI that turns open-ended questions into structured, cited tables, hardened it with 150+ automated tests, and deployed it as a live service; I also built an agent that automates evaluation-suite improvement and commits only accepted updates back to Git. Day to day I work in Python and JavaScript, design and consume REST APIs, and use Git as a default.

Before grad school I spent two years as a backend engineer, where I owned a multi-tenant production system serving 8+ UK clinical clients and over 10,000 monthly submissions. That experience is why I treat testing, code reviews, and troubleshooting as the job rather than an afterthought, and it is a big part of why the practical, business-facing side of AI appeals to me more than the hype. I pick up new tools quickly and enjoy working with both engineers and non-engineering stakeholders to figure out what is actually worth building. I am targeting a Fall 2026 internship.

Thank you for considering my application. I would welcome the chance to talk about how I can help Festo turn AI into dependable, useful software.

Sincerely,

Deva Anand
