SAP iXp Hiring Team
SAP, Palo Alto, California

Dear SAP iXp Hiring Team,

I am excited to apply for the AI Engineer Intern role on the SAP Customer Success team. I am a Computer Science master's student at UMass Amherst with two years of production backend experience and a graduate focus on LLMs, retrieval, and evaluation, which maps closely to the AI use cases this role explores.

Most of my recent work is exactly the loop you describe: prototype an AI capability, integrate it behind an API, and measure whether it actually helps. I built AgenticSearch, a FastAPI service that turns open-ended queries into structured, source-attributed tables using retrieval planning and deterministic extraction with an LLM fallback, and hardened it with over 150 automated tests. In a graduate project I built the multi-view retrieval component of a RAG pipeline that lifted supporting-fact recall by 2.68% on a 4,905-question benchmark, and in another I built an evaluation-improvement agent with anti-Goodharting guardrails so that only changes which genuinely raise discriminative power are accepted. I care as much about measuring and documenting an AI feature as about building it.

I am also drawn to the customer-outcome and internal-productivity focus of this team. At Wysa I owned a multi-tenant enterprise SaaS backend serving 8+ UK clients and 10,000+ monthly submissions, and I built an internal tool for the AI team that cut manual annotation work by 100+ hours a month and lifted labeling throughput 60%, which is the same kind of applied-AI-for-operational-effectiveness work this role centers on. I am currently a founding engineer at an early-stage startup, so I am comfortable iterating fast, shipping under ambiguity, and picking up new tools quickly.

I would love to bring that mix of production engineering and AI experimentation to SAP Customer Success, and to learn how you ship responsibly and measure impact at enterprise scale. Thank you for your consideration.

Sincerely,
Deva Anand
