Tektronix, Oscilloscope Platform Team
Beaverton, OR

Dear Hiring Team,

I am applying for the Software Engineering Intern (Oscilloscope Platform) co-op. I am a Master's student in Computer Science at UMass Amherst whose work sits where software correctness meets measurement and performance, and a test & measurement platform is exactly the kind of place I want to do that work: software where a wrong number is a real defect, not a cosmetic one.

The part of this role I am most prepared for is the validation and performance side. For a coursework performance project on the NYC TLC dataset (~1.4B rows), I ran controlled experiments comparing a naive and a tuned Spark pipeline, profiled stage-level timings with Spark UI to localize shuffle and skew bottlenecks, cut end-to-end runtime ~25%, and wrote the results up as a repeatable playbook. That “investigate a risk area, run an experiment, share what the data says” loop is the part of your job description I am most drawn to. My graduate Performance Engineering coursework backs it up with profiling, multithreading, memory-hierarchy and cache-aware design, and SIMD concepts.

I also care about test strategy and regression health, which your team calls out directly. At Wysa, I took features through the full lifecycle on multi-tenant NHS systems serving 8+ UK clients, built integration and regression tests to protect critical workflows, and monitored production logs to reproduce and fix issues during releases, all in an Agile/Scrum team. On a personal project (AgenticSearch) I hardened a service with 150+ automated tests plus pipeline instrumentation so behavior stays predictable and debuggable. I am comfortable owning test plans and the CI signal that keeps them honest.

I want to be straight about fit: my hands-on C/C++ is at the coursework and working-knowledge level rather than years of embedded firmware, and I have not yet worked with Qt or on instrument hardware. What I bring instead is the habit of working close to the metal and across layers. For the Qualcomm Edge AI Hackathon I built Sonare, a cross-platform desktop app that wires camera, microphone, UI, and backend into a fully offline on-device pipeline, exactly the kind of bridging between a UI and lower-level processing your platform asks for. With a dedicated mentor and real instruments, I am confident I can close the C/C++ and embedded gap quickly, and I would bring strong profiling, testing, and communication habits from day one. I have presented technical results before, including a first-author IEEE CONIT 2023 paper, so the end-of-term stakeholder presentation is a part I look forward to.

Thank you for considering my application. I would welcome the chance to talk about how I can contribute to the oscilloscope platform team.

Sincerely,
Deva Anand
