Nokia
Special Projects Software Dev Co-op Hiring Team
Naperville, IL / Dallas, TX

Dear Hiring Team,

I'm applying for the Special Projects Software Dev Co-op. I'm a Computer Science master's student at UMass Amherst with two years of production backend experience, and the role reads like a good match for how I already work: building and prototyping software in Python and FastAPI, improving the team's tooling and automation, and shipping inside an Agile/Scrum process.

Most of my recent work lives at the intersection of software development and AI tooling, which lines up with the automation and AI-tool side of this role. I built **AgenticSearch**, a Python and FastAPI service that turns open-ended queries into structured, verified results, hardened with 150+ automated tests, and **AutoEval**, an agent that automatically improves a software evaluation suite with guardrails to keep it honest. At Wysa I also took part in a GitHub Copilot productivity pilot, helping improve our AI-assisted development workflow for code migration, tech-debt cleanup, and review while keeping the generated code aligned to our conventions, the same kind of "make the development environment better" work this position calls for.

On the core engineering side, I spent two years as a backend engineer at Wysa building a multi-tenant healthcare platform on Node.js and MongoDB for 8+ UK clients (10,000+ monthly submissions), and earlier built 20+ REST APIs in Node.js and Fastify over PostgreSQL at Cario. I worked the whole time in Agile/Scrum sprints with planning, stand-ups, and retrospectives, and a lot of the job was practical debugging: reading production logs, isolating tenant-specific issues, and shipping fixes. I'm comfortable in Linux and Git, and I like the prototyping rhythm this role describes, taking a rough idea and turning it into working software quickly.

What appeals to me about Nokia is that 5G and the networks behind it are real, large-scale infrastructure, and a special-projects team is exactly where I'd want to learn, contributing across prototyping, automation, and verification rather than staying in one narrow lane. I'd bring a self-motivated, collaborative attitude and a genuine eagerness to make myself useful from week one.

Thank you for your time and consideration. I'd welcome the chance to discuss how I can contribute.

Sincerely,
Deva Anand
