Dear Nuro Hiring Team,

I am applying for the Software Engineering Internship at Nuro. Your mission, making autonomy accessible by building the world's most scalable driver, is exactly the kind of systems problem I want to work on, and the breadth of your teams maps closely to what I have built and what I am studying: I am an MS Computer Science student at UMass Amherst with two years of production backend experience, focused on data systems, performance, and machine learning.

The work that most resonates with me is your Data Platform. At Wysa, I owned backend reliability for multi-tenant systems serving 8+ clients and 10,000+ monthly submissions, and I architected a full-stack data annotation platform used daily by the AI team to label and manage training data for production models, replacing spreadsheet workflows and cutting 100+ hours per month of manual work while improving labeling throughput by 60%. Building the infrastructure that manages data, labels, and the people who produce them is precisely what your Data Platform team does.

I also gravitate toward performance and scale. I optimized a Spark ETL pipeline over a roughly 1.4-billion-row dataset, cutting end-to-end runtime about 25% and the analytics tail-latency ratio from 2.14x to 1.74x by reasoning through shuffle, skew, and partitioning with Spark UI. My graduate Performance Engineering coursework, covering profiling, cache-aware design, vectorization, and multithreading, sharpened how I think about throughput, which is directly relevant to your Technical Infrastructure and ML Infrastructure teams' work on large-scale data processing and optimized training and inference.

Finally, I build ML systems from first principles. In graduate Advanced Machine Learning I implemented a reverse-mode automatic differentiation engine from scratch in NumPy, validated against JAX, and benchmarked neural architectures on CIFAR-10, and at the Qualcomm Edge AI Hackathon I shipped an offline, on-device application running MediaPipe and whisper.cpp with no network dependency. I am comfortable across the stack, from C++ and Python algorithms to backend services and ML, and I am eager to learn the autonomy domain from your team.

I would be thrilled to bring this systems-and-data mindset to Nuro and contribute from day one. Thank you for considering my application; I would welcome the chance to talk.

Sincerely,

Deva Anand
